

Rising Waters: A Machine Learning Approach to Flood Prediction

Empathy Map

Empathy Map

Create an empathy map to understand your customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

SAYS • "We need accurate flood predictions before disasters occur." • "Early warning systems can help save lives and reduce damage." • "The prediction system should provide quick and reliable results."	THINKS • "How can we identify flood risks earlier?" • "Can machine learning improve the accuracy of flood predictions?" • "How can we better plan evacuation and emergency response?"
PERSONA NAME (Role / User Type)	
DOES • Monitors weather conditions and rainfall information. • Analyzes flood risk data for decision-making. • Plans evacuation activities and allocates disaster management resources.	FEELS • Worried about unexpected flood situations. • Needs confidence in prediction accuracy. • Feels responsible for protecting communities from flood impacts.
